

How To Prevent Mosquitoes

Once a week, empty and scrub, turn over, cover, or throw out any items that hold water like tires, buckets, planters, toys, pools, birdbaths, flowerpot saucers, or trash containers.

Once outdoor standing water conditions are removed or minimalized, adults will rest under plants, dense brush and tall grasses as well as under leaves and bushes.

They rest in moist, shady areas and can be found under porches and decks as well.

Knowing where adult mosquitoes can reside is useful when using outdoor mosquito products.

To kill adult mosquitoes, an outdoor adulticide is recommended. An adulticide is a type of insecticide used to kill adult mosquitoes. According to the CDC website, adulticides are available in three forms: coils, foggers and yard sprays/aerosols.
